### How can I create embedded URLs for authenticating users?

You can add a suffix to the end of a URL to direct your patrons to a specific group or profile, such as a business section or a children's collection. After `login.aspx`, you can add a question mark (?) and then include the specific information. For example:

You can also add any of these suffixes to `custlogin.asp`, `reflogin.asp`, and `cpidlogin.asp`. This lets you direct your patrons to a specific group or profile if you are using patron files, referring URLs, or patterned IDs to authenticate.

<table>
<thead>
<tr>
<th>To direct the patron to:</th>
<th>Add the following to <a href="http://search.ebscohost.com/login.aspx">http://search.ebscohost.com/login.aspx</a></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>A specific profile</td>
<td>?profile=profileid</td>
<td>Where <code>profileid</code> identifies one of the profiles you set up.</td>
</tr>
<tr>
<td>A specific group</td>
<td>?group=groupid</td>
<td>Where <code>groupid</code> identifies one of the user groups you set up.</td>
</tr>
<tr>
<td>A specific group and profile</td>
<td>?group=groupid&amp;profile=profileid</td>
<td></td>
</tr>
<tr>
<td>A specific interface</td>
<td>?interfaceid=</td>
<td></td>
</tr>
<tr>
<td>One or more default databases</td>
<td>?defaultdb=shortDBname&amp;defaultdb=shortDBname</td>
<td>Where the <code>shortDBname</code> identifies the database to if the profile has rights to that database.</td>
</tr>
</tbody>
</table>
