What metadata elements can I use when I create a Full Text Finder CustomLink?

To view a document of the supported Full Text Finder metadata elements, click here.

This comprehensive list contains a wide selection of metadata elements that Full Text Finder can use to insert metadata into a CustomLink. You can use these data elements in your CustomLink simply by including the FTF Fact Name surrounded by curly braces {}.

**NOTE:** While Full Text Finder supports all of these fields, the data is contingent on the Source data that Full Text Finder is provided. A field’s listing here is not an indication that Full Text Finder will always be able to provide this data for a link.
