Why do I sometimes get "No results were found" for supplemental content on the EBSCOhost OpenURL server from PubMed LinkOut?

Unfortunately, there is no current standard for indexing supplemental metadata. This makes linking to supplemental content difficult for all link vendors. The EBSCOhost OpenURL server will provide you with an option to modify your metadata when a full text match is not found. When this occurs, please try removing the volume and/or issue field data from the OpenURL's "verify request" page and then click on the Submit button. The remaining metadata fields (issn, date, article title, author, and start page) will be used in an attempt to find a match.
